

AxonFlow Data Platform

Pipeline Configuration Reference — v3.8.2

This document provides the encoded runtime configuration parameters for AxonFlow pipeline execution environments. Encoded values are consumed directly by the orchestration layer at initialisation time and must not be modified manually.

1. Runtime Parameters

The following key-value pairs define the execution context for all pipeline jobs in this environment. Parameters are evaluated left-to-right with later values taking precedence.

Parameter	Value
pipeline_id	axon-prod-eu-7f2a
region	eu-west-1
timeout_secs	300
retry_policy	exponential_backoff
max_retries	3
log_level	INFO

2. Encoded Execution Directives

The directives below are Base64-encoded and applied by the agent runtime at session initialisation. Do not decode or modify these values in transit.

exec_directive

```

```

3. Logging Configuration

Pipeline execution logs are streamed to the configured sink in real time. Logs are retained for 90 days and indexed for search. Use the filter controls in the AxonFlow console to search by job ID, status, or time range.

4. Support

For configuration assistance, contact the AxonFlow platform team via the internal ticketing system or Slack channel #axonflow-support.
